Project Design Phase-II
Technology Stack (Architecture & Stack)

Date	31 January 2026
Team ID	Individual
Project Name	EV Market Performance & Sustainability Analytics
Maximum Marks	2 Marks

Define Your Technology Stack:

Identify the technologies, platforms, databases, BI tools, and integrations that you will use to build your Business Intelligence solution. A well-chosen technology stack helps ensure that the solution is scalable, maintainable, secure, and suitable for data analysis and reporting requirements.

S.No	Component	Description	Technology	Justification / Purpose
1	Programming / Query Language	Language used to query, filter, transform, aggregate, and analyse data.	Tableau calculated fields; no separate programming language required for the current workbook.	Calculated fields provide KPI calculations and derived measures directly in Tableau.
2	Database / Data Warehouse	Source used to store and manage structured data.	CSV / Excel source file	Matches the supplied dataset and can be connected directly to Tableau Desktop.
3	Data Ingestion	Load source records into the analytical environment.	Tableau Desktop Data Source connection	Connects the source file to Tableau without requiring a separate ingestion platform.
4	Data Transformation and Business Logic	Prepare fields, aggregate measures, and calculate business metrics.	Tableau Desktop; calculated fields; data-source settings	Supports data-type checks, filters, aggregation, and KPI calculations in the existing project.
5	Data Visualization / Analytics	Create interactive dashboards, charts, KPIs, and visual analysis.	Tableau Desktop	Used to build the project's KPI cards, line chart, bar chart, donut charts, heatmap, scatter plot, and range/manufacturer views.
6	Front-End / User Interface	Allow users to interact with filters, tooltips, and dashboards.	Tableau Dashboard; Tableau Public only if published	Provides the dashboard interface. Tableau Public is a publishing option, not assumed to be already used.
